## Test report P-BA 71/2010e

Determination of the Acoustic Performance  
of a Wastewater Installation System in the Laboratory

Client: COES Company  
Via Caduti del Lavoro N° 9/a  
20096 PIOTTELLO (MI)  
ITALY

Test specimen: Wastewater installation system consisting of "BluePower" plastic  
pipes (manufacturer: COES) mounted with pipe clamps "Bismat  
1000" (manufacturer: Walraven).

Contents: Table 1: Summary of test results  
Figures 1 to 3: Detailed results  
Figures 4 and 5: Test set-up  
Annex A: Measurement set-up, noise excitation,  
acoustic parameters  
Annex F: Evaluation of measurements  
Annex P: Description of test facility

The tests were performed in a laboratory accredited by the  
German Accreditation System for Testing (DAP, file no. PL-  
3743.26) according to standard EN ISO/IEC 17025.

Test Report P-BA 65/2024e

### Determination of the Acoustic Performance of a Wastewater Installation System in the Laboratory according to DIN EN 14366-1

Client: Istituto Italiano Dei Plastici Srl  
Via Velleia 2  
20900 Monza (MI)  
Italy

Test specimen: Wastewater system made of plastic "SERI PLAST Multilayer Pipe, PP, DN 110 x 2.7, (production date: 30/05/23)" with fittings "COESPREENE HTEA, PP-H" made by Coes Company with acoustic pipe clamps "Bimat 1000", made by Wälwaen.

Content: Sheet 1: Test setup, test facility and test method  
Results 1: Summary of test results (part 1)  
Results 2: Summary of test results (part 2)  
Results 3: Comparing products: Calculated Single Number Quantities (SNQ)  
Table 1: Building situation: Prediction based on DIN EN 12354-5  
Figure 1: Disputed results  
Figure 2+3: Test set-up  
Annex A: Measurement setup and assessment of measurement results  
Annex F: Evaluation of measurements  
Annex P: Disposition of the test facility

Test date: The measurement was carried out on February 12<sup>th</sup>, 2024 in the test facilities of the Fraunhofer Institute for Building Physics in Stuttgart.

Stuttgart, April 12, 2024

Test Engineer:

B. Eng. N. Dachtler

Head of the test laboratory:

M.B. Dipl.-Ing. (FH) S. Ohler

The test was carried out in laboratory facilities of the IBP which is accredited according to DIN EN ISO/IEC 17025:2018 by the DAkkS. The accreditation certificate is D-PL-11140-11-00.

The mentioned measuring results exclusively refer to the investigated test object. Any publication of this document in part is subject to written permission by the Fraunhofer Institute for Building Physics (IBP).

| <p><b>Test specimen:</b> Wastewater system made of plastic "SERI PLAST Multilayer Pipe, PP, DN 110 x 2.7, (production date: 30/05/23)" with fittings "COESPREENE HTEA, PP-H", made by Coes Company with acoustic pipe clamps "Bimat 1000", made by Wälwaen. Test object no.: S 12171-01; see Figures 2 and 3.</p> <p><b>Test set-up:</b> The pipe system was mounted according to Figures 2 and 3 (see also Annex A). The pipe system consisted of straight wastewater pipes (nominal size DN 110, three inlet tees (1-88"), a 2 x 45" basement bend and a horizontal drain section. The inlet tees in the basement and on the ground floor were closed by lids supplied by the manufacturer.</p> <p><b>Pipe system:</b> "SERI PLAST" Multilayer Pipe, PP, DN 110 x 2.7 (production date: 30/05/23). Three-layer pipes with shaped pipe sockets. Material: PP, wall thickness = 3.1 mm, weight = 1.01 kg/m, density = 0.99 g/cm³, values measured by BP. One-layer fittings: "COESPREENE HTEA". Material: PP-H, wall thickness = 3.1 mm, density = 1.0 g/cm³, values measured by BP. Plug connection of the pipes and fittings (shaped pipe sockets).</p> <p><b>Pipe clamps:</b> "Bimat 1000". Structural-borne sound isolating support attachment consisting of Bimat SL guidance clamps and Bimat SX saddle clamps. In each story (UG and UG) respectively predrilled clamp was installed at the lower wall area. To prevent contact to the pipe, the guidance clamp (SL) was mounted with 15 mm space between the locking tabs of the clamp (two 7.5 mm spacers on each side) in the upper wall area. The Bimat 1000 clamps were fixed to the installation wall with an adjustable wall plate with screws and thread rods.</p> <p>The wastewater installation system was mounted by a technician under the authority of Fraunhofer IBP.</p> |               |
| <p><b>Test facility:</b> Installation test facility P12, mass per unit area of the insulation wall 220 kg/m², mass per unit area of the ceiling 440 kg/m². Installation rooms sub-basement (KG), basement (UG) front, ground floor (UG) front and top floor (DG), measuring rooms: UG front, UG rear (details in Annex P and DIN EN 14366-1:2023-09).</p> <p><b>Test method:</b> The measurements were performed according to DIN EN 14366-1; noise excitation by steady water flow with 0.5 l/s, 1.0 l/s, 2.0 l/s and 4.0 l/s. Measured and calculated variables: airborne sound power level and single equivalent blocked force level (Results 1), single equivalent free velocity level and magnitude of single equivalent source mobility (Results 2). Details see Annex A and Annex F.</p> <p><b>Comparing products: Calculated Single Number Quantities (SNQ):</b> Please use the calculated values according to DIN EN 12354-5:2023-08, Annex G.4 in Results 3, stating the flow rates, mounting conditions and used pipe clamps for advertisement. Additionally, Table 1 shows the predicted results for the test facility P12 at Fraunhofer IBP in Stuttgart.</p> <p><b>Note:</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |               |
| <p>The test was carried out in laboratory facilities of the IBP which is accredited according to DIN EN ISO/IEC 17025:2018 by the DAkkS. The accreditation certificate is D-PL-11140-11-00.</p> <p>Stuttgart, April 12, 2024</p> <p>Head of the test laboratory:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |               |

| Comparing products: Calculated Single Number Quantities (SNQ)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | P-BA 65/2024e       |

| <p><b>Test specimen:</b> Wastewater system made of plastic "SERI PLAST Multilayer Pipe, PP, DN 110 x 2.7, (production date: 30/05/23)" with fittings "COESPREENE HTEA, PP-H", made by Coes Company with acoustic pipe clamps "Bimat 1000", made by Wälwaen. Test object no.: S 12171-01; see Figures 2 and 3.</p> <p>Mounting conditions see Sheet 1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                     |
| <p><b>According to DIN EN 14366-1, two quantities are used for comparing products (wastewater systems):</b></p> <ul style="list-style-type: none"> <li>A-weighted airborne sound power level for the radiated airborne sound in the source/installation rooms.</li> <li>A-weighted apparent structure-borne sound pressure level generated in buildings.</li> </ul> <p>In the two building examples given below, one for heavy buildings and one for lightweight buildings, the single number quantities (SNQ) are calculated. Details of the example buildings are shown in DIN EN 12354-5, Annex G.4. However, the SNQ obtained here shall not be used in current verification in any other buildings. A prediction for the building considered is then required and shall be performed according to DIN EN 12354-5.</p> <p><b>a) Heavy building (DIN EN 12354-5, Annex G.4.2):</b><br/>The heavy building configuration has 18 cm concrete floors and separating walls with a surface mass of 220 kg/m². The values for <math>L_{w,iso}</math> are given in Table G.12 in DIN EN 12354-5, Annex G for the horizontal transmission indicated in Figure G.6 and are used for calculating the SNQ in the table below.</p> <p><b>b) Lightweight building (DIN EN 12354-5, Annex G.4.3):</b><br/>The building configuration has a similar frame type (see Annex F) as the one used in G.3.1 but with timber studs. Its mobility, required to calculate the insulated pipes, is given in Table G.14. The values for <math>L_{w,iso}</math> are given in Table G.13 in DIN EN 12354-5, Annex G for the horizontal transmission indicated in Figure G.6 and are used for calculating the SNQ in the table below.</p> |                     |

| <p><b>Test specimen:</b> Wastewater system made of plastic "SERI PLAST Multilayer Pipe, PP, DN 110 x 2.7, (production date: 30/05/23)" with fittings "COESPREENE HTEA, PP-H", made by Coes Company with acoustic pipe clamps "Bimat 1000", made by Wälwaen. Test object no.: S 12171-01; see Figures 2 and 3.</p> <p>Mounting conditions see Sheet 1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                  |                           |                 |                                                                                                   |                 |                                                                                |  |                               |                                  |                                     |  |                               |                                  |                                     |  |                                                                               |  |                               |                                  |                                     |  |                               |                                  |                                     |  |
| <p><b>Prediction method:</b></p> <p>In this case the predicted values are calculated using a measured transfer function acc. to DIN EN 60 10648 for the transmission from the source room to the receiving room in the test facility P12 at Fraunhofer IBP in Stuttgart. For the prediction only the structure borne sound is considered, but the airborne sound transmission is negligible for the SNQ.</p> <p><b>Present building situation for this prediction:</b></p> <p>In this case the calculations are based on the building situation in the test facility P12 at Fraunhofer IBP in Stuttgart, details see Annex P. The source room is the front room of the basement (UG front) and the receiving room is the horizontal room (UG rear). All floor/ceiling and all flooring with the installation wall are made of 19 cm thick concrete (weight per unit area approx. 240 kg/m²). The installation wall itself is 11.5 cm thick limestone, plastered on both sides (weight per unit area approx. 220 kg/m²).</p>                                                                                                                                                                                                      |                                  |                           |                 |                                                                                                   |                 |                                                                                |  |                               |                                  |                                     |  |                               |                                  |                                     |  |                                                                               |  |                               |                                  |                                     |  |                               |                                  |                                     |  |

### CONDICIONS GENERALS DE SOMI PIPES AND FITTINGS SL:

#### PREUS:

els preus de tarifa són de VENTA AL PÚBLIC, i poden ser modificats sense previ avís.

#### EXPEDICIONS:

el material viatja sempre per compte i risc del comprador.

#### RESERVA DE PROPIEDAD:

els materials subministrats seran propietat de Somi Pipes and Fittings SL, fins que no s'hagi realitzat el pagament dels mateixos.

#### ANUL·LACIÓ DE MATERIAL:

No s'admetran anul·lacions de comandes que ja estiguin fabricades o demanades de manera expressa. (Manipulats o material fora de catàleg/tarifa).

#### DEVOLUCIÓ DE MATERIAL:

No s'admetran devolucions de material sense prèvia confirmació i després de 15 dies de la recepció de la mercaderia. El material tornat, haurà d'estar en perfectes condicions. Si no fos així, ens reservem el dret de carregar un demèrit en el seu abonament.

#### CONDICIONS D'ENTREGA:

Les comandes podran ser subministrades NO en la seva totalitat sense que això suposi l'anul·lació de les mateixes.

No es cobraran ports si es respecta la comanda mínima per cada zona (determinada per cada client).

#### GARANTIA:

La garantia dels nostres materials queda limitada a la reposició del producte, model o peça que sigui reconeguda com a defectuosa.

Queden fora de garantia els materials defectuosos per un us inadequat a la seva funció.

#### RESERVA:

Ens reservem el dret a introduir modificacions de disseny, mides i/o preus, sense previ avís.

**Aquesta tarifa està subjecta a modificació sense previ avís, i no te caràcter contractual.**
